5G EVE
Technical Overview for ICT19 Proposers

5GPPP Ph3 Info Day

14th Sep 2018

Manuel Lorenzo (ERI-ES)

5G EVE

Intro to 5G EVE: Technical Aspects

- Let's now focus on the technical aspects of 5G EVE
  - First, we will review why testbeds like 5G EVE are instrumental for growing the 5G ecosystem, and how we at 5G EVE project interpret that motivation and translate into a technical set-up for fruitful collaboration with Verticals
  - Next, we will introduce the basics on what 5G EVE services -based on both core 5G technologies and differential 5G EVE innovations- are planned to be accessible to Verticals.
  - Then, we will share how our current technical collaboration model with 5G EVE participant verticals is, and how we propose to extrapolate it to new collaborations with ICT-19 partners

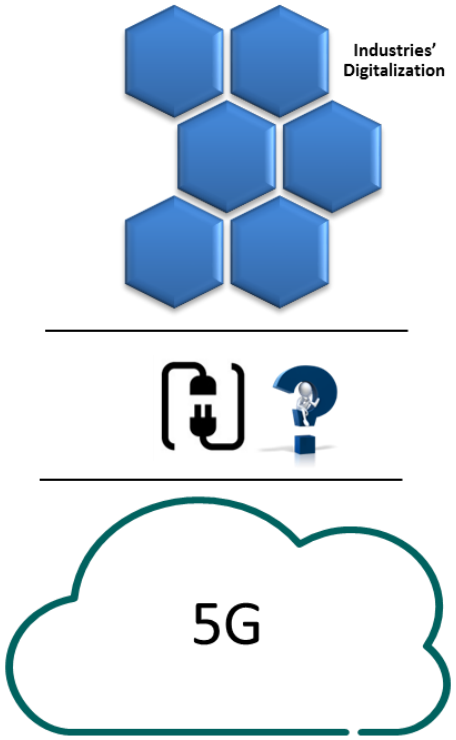
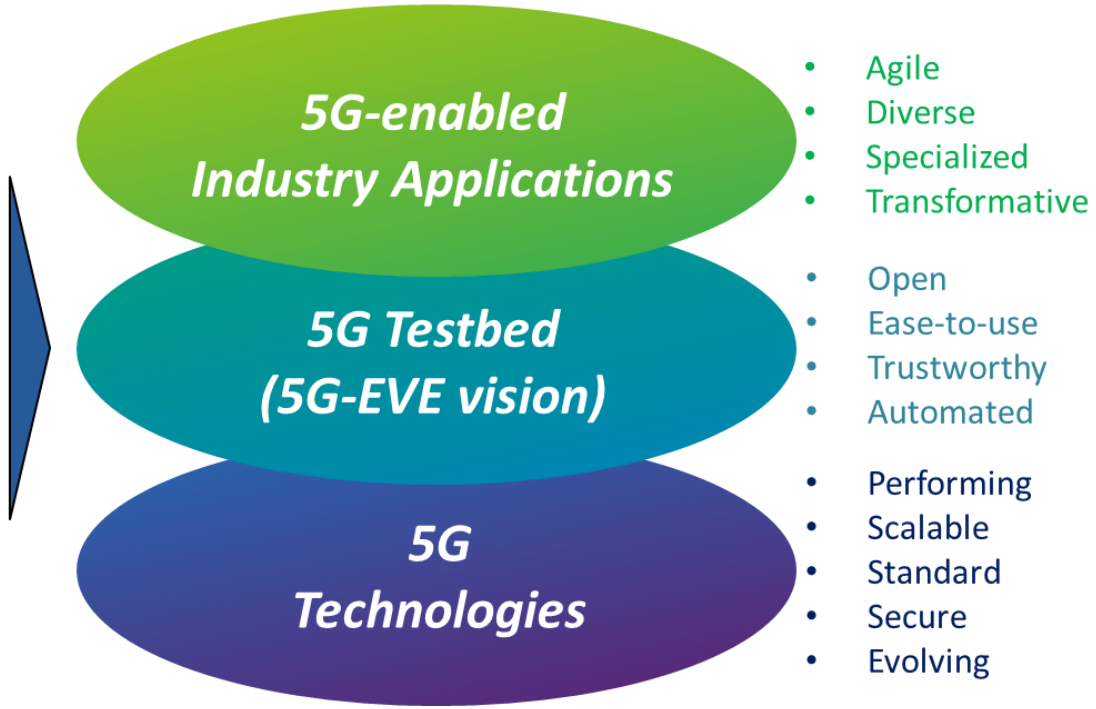
5G EVE

Why a Testbed like 5G EVE?

From: Two Worlds



To: One Innovation Ecosystem



- Agile
- Diverse
- Specialized
- Transformative

- Open
- Ease-to-use
- Trustworthy
- Automated

- Performing
- Scalable
- Standard
- Secure
- Evolving

5G EVE

What 5G EVE testbed can support you with

Evolving 5G technologies for …

Enabling your Validation tests against State-of-the-art 5G Technologies

MASSIVE MIMO

SP IT FR

Combination of Single-User MIMO (SU-MIMO) and beamforming supported by advanced antennas with a large number of steerable ports. Massive MIMO improves both the user experience and the capacity and coverage of the network.

MULTI-USER MIMO

SP IT FR

Building on Massive MIMO, Multi-User MIMO (MU-MIMO) transmits data to multiple user devices using the same time and frequency resources and coordinates beamforming. MU-MIMO provides a better user experience, enhances network capacity and coverage, and reduces interference.

RAN VIRTUALIZATION

GR SP FR

Improves network efficiency and performance by enabling Virtual Network Functions (VNF) to be centralized on a common platform supporting both 4G and 5G.

LATENCY REDUCTION

GR SP IT FR

Shortens access procedures and modifies the frame structure to enable instant network access and more frequent transmissions. This in turn reduces time-to-content while enabling real-time communications for key 5G applications such as smart vehicles.

INTELLIGENT CONNECTIVITY

GR

Where 5G and 4G coverage areas overlap, Intelligent Connectivity enables the network to robustly anchor and intelligently route data based on application needs and network resource availability, increasing the combined data throughput of 4G and 5G resources.

And these are just a few of the many 5G features supported by 5GEVE testbed

This Project has received funding from the EU H2020 research and innovation programme under Grant Agreement No 815074

5G EVE

What 5G EVE testbed can support you with
5G EVE Specific Innovations for …

Increasing effectiveness and efficiency of your 5G Validation activities

1 Intent-based interface towards verticals	**A disruptive intent-based interface to simplify the access to the 5G end to end facility, specifying "what" is asked without details on "how" it is provided.**
2 Multi-domain slicing and orchestration	**A new orchestration framework with the necessary features able to manage effectively multiple site facilities, dramatically improve efficiency, prevent overload, and easily manage migration of networks components, while meeting performance requirements.**
3 Performance Diagnostics (KPI Framework)	**A completely new performance diagnosis mechanism and a new monitoring framework enabling the capturing of service and slice performance indicators, providing insight on performance.**
4 5G VNF's (Openness Framework)	**A new framework to provide a modular, reusable set of different SFs enabling the coexistence of proprietary and open source technologies; this will allow the modular replacement and chaining of components implemented with open and novel performance acceleration techniques.**
